 - 32. (Cancelled, without prejudice)
 - 33. (Cancelled, without prejudice)

- 34. (Currently Amended) An optical disc reproducing device reproducing an optical disc having pits of at least two different depths formed therein, comprising:
 - a photoreceptor element detecting a light beam reflected from said optical disc;
 - a pit depth detecting unit detecting depth of the pit formed on said optical disc based on the quantity of the reflected light beam detected by said photoreceptor element;
 - a servo signal generating unit generating a tracking servo signal based on the quantity of the reflected light beam detected by said photoreceptor element; and
 - a polarity inverting unit inverting polarity of the tracking servo signal generated by said servo signal generating unit based on the result of detection by said pit depth detecting unit; wherein
 - said pit depth detecting unit includes a first detecting unit

 detecting a first signal based on the quantity of

 reflected light beam from said optical disc;
 - a second detecting unit detecting a second signal indicative
 of the difference in intensity distribution of the
 reflected light beam along the tangential direction of
 the pit string on said optical disc, and
 - a third detecting unit detecting the depth of the pit formed
 in said optical disc based on the first signal detected
 by said first detecting unit and the second signal
 detected by said second detecting unit; and

wherein

- said third detecting unit includes a first comparing circuit

 comparing the second signal detected by said second
 detecting unit with a first reference value,
- a second comparing circuit comparing the second signal

 detected by said second detecting unit with a second
 reference value, and
- a flip-flop circuit holding the result of comparison by said

 first comparing circuit and the result of comparison

 by said second comparing circuit, at a point of

 transition of the first signal output from said first

 detecting unit.
- 35. Canceled, without prejudice.
- 36. Canceled, without prejudice.
- 37. Canceled, without prejudice.
- 38. Canceled, without prejudice
- 39. Canceled, without prejudice.

- 40. Canceled, without prejudice.
- 41. (Currently Amended) An optical disc reproducing device reproducing an optical disc having pits of at least two different depths formed therein, comprising:
 - a photoreceptor element detecting a light beam reflected from said optical disc;
 - a pit depth detecting unit detecting depth of the pit formed on said optical disc based on the quantity of the reflected light beam detected by said photoreceptor element;
 - a servo signal generating unit generating a tracking servo signal

 based on the quantity of the reflected light beam detected
 by said photoreceptor element; and
 - a polarity inverting unit inverting polarity of the tracking servo
 signal generated by said servo signal generating unit based
 on the result of detection by said pit depth detecting unit -;

The optical disc reproducing device according to claim 34,

wherein

- said photoreceptor element includes a first element and a second element divided along the radial direction of said optical disc,
- said first element includes a third element and a fourth element divided along the radial direction of said optical disc, and said second element includes a fifth element and a sixth element divided along the tangential direction of the pit string.
